> RANKINGS OF INDIVIDUAL INDUSTRIES BY THEIR RELATIVE FIRE HAZARD

> > Ъý

Jane M. Hogg

### SUMMARY

Two lists ranking industries by their relative fire hazard have been drawn up. The first is concerned with fires which originated in areas of production, the second with fires which originated in storage areas.

December, 1964.

### RANKINGS OF INDIVIDUAL INDUSTRIES BY THEIR RELATIVE FIRE HAZARD

and the second states

and the second second

**by** 

#### Introduction

For the purposes of fire legislation it would be useful to be able to assess the relative hazard of different industries. In this note the industries are defined in accordance with the Central Statistical Office's Standard Industrial Classification (1958). Fires in industrial buildings in Great Britain which were attended by fire brigades during the period 1957-61 inclusive have been classified according to the industry in which they occurred.

#### The method of ranking

It has been shown elsewhere<sup>(1)</sup> that the frequency of fires in industrial premises during the period 1957-61 inclusive was dependent upon a component of industry. This component has been assumed to represent the size of the industry since it was derived from factors of industry which are related to size, for example, the number of establishments and the average number employed, the annual output etc. The dependence of fires upon this component of industry is stronger than any dependence which can be observed with the individual factors that went into this composite index.

Since a component of industry has been found to affect the frequency of fires in industrial premises it is not possible to evaluate the relative fire hazard of different industries by simply comparing the number of fires which occurred in those industries over a period of time. The number of fires expected at any given component value has also to be taken into account, and this is most conveniently achieved by standardizing upon the average value of the component. Ranking lists have thus been arrived at by estimating the number of fires which would have occurred in the period 1957-61 inclusive on the assumption that each industry was of average industry size as measured by the component of industry (the index of fires).

The index is calculated as the logarithm of the number of fires attributed to each industry because the law relating the fire frequencies to the component of industry is of logarithmic form.

All the reports of fires attended by brigades in 1957 were examined; in the other years, however, only samples of the reports have been used. In order that the fire experience of each year would be given the same weight, the total number of fires recorded for each industry over the five year period is, in fact, a weighted total of the fires examined in the yearly samples.

Two ranking lists are shown in the Appendix. The first is concerned with fires which originated in areas of production, the other with fires which originated in storage areas. In general, in both areas the timber, furniture, etc. industries are the most hazardous, and the engineering and electrical goods industries are the least hazardous. Too much emphasis should not be placed on the difference between industries close to each other on the ranking list since this difference could have occurred by chance. The further apart industries are on the ranking list the more likely are they to have a different fire hazard.

#### Conclusion

The number of fires which occurred in industrial premises during 1957-61 inclusive have elsewhere been found to be dependent upon a component of industry. This component has been assumed to represent industry size. Fire frequencies have been standardized on this average industry size, and industries have been ranked according to the standardized frequencies. Two ranking lists have been drawn up. The first is concerned with fires which originated in areas of production, the second with fires which originated in storage areas. The further apart industries are on these ranking lists the more likely are they to differ from each other in their relative fire hazard.
